

RGB Controller Program descriptions:

These particular controllers are pretty straight forward and do not come with a manual. The Customer can change two things on controller. They can push the button to change between 9 preset programs which show up on the digital display:

1. Change from color to color, staying on between color changes (white, red, yellow, green, light blue, blue, pink)
2. Change from color to color, turning off between color changes (white, red, yellow, green, light blue, blue, pink)
3. Dimming from color to color, turning off between color changes (white, red, yellow, green, light blue, blue, pink)
4. On/Off White only
5. On/Off Red only
6. On/Off green only
7. On/Off blue only
8. Dimming from color to color, staying on between color changes (white, red, yellow, green, light blue, blue, pink)
9. Stop at any color

They can turn the dial with a screw driver to increase or decrease the speed at which the different above programs perform their functions.

In order to perform more elaborate, or customer color changes, which these RGB modules will perform, they will need to purchase another programmable controller which they can find on the internet, or from another source.
